# 1 Problem 1

### 1.1 Problem

Consider a particle which is free to be anywhere, with equal probability, on a line segment of length L.

- (a) Find the normalized probability distribution for such a particle.
- (b) Calculate  $\langle x \rangle$  and  $\sigma_x$ .
- (c) Calculate the probability of finding the particle within  $\sigma_x$  of  $\langle x \rangle$ .
- (d) What are the dimensions of the probability density?

#### 1.2 Solution

- (a)  $\frac{1}{L}$
- (b)

$$\langle x \rangle = \frac{1}{L} \int_0^L x \, dx = \frac{L}{2}$$

$$\sigma_x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$$

$$\langle x^2 \rangle = \frac{1}{L} \int_0^L x^2 \, dx = \frac{L^2}{3}$$

$$\langle x \rangle^2 = \frac{L^2}{4}$$

$$\sigma_x = \sqrt{\frac{L^2}{3} - \frac{L^2}{4}} = \frac{L}{2\sqrt{3}}$$

- (c)  $\frac{1}{L} \int_{\frac{L}{2}(1-\frac{1}{\sqrt{3}})}^{\frac{L}{2}(1+\frac{1}{\sqrt{3}})} dx = \frac{1}{\sqrt{3}}$
- (d)  $length^{-1}$

# 2.1 Problem

Buffon's Needle: A needle of length l is dropped at random on a sheet of paper with parallel lines a distance l apart. What is the probability that it crosses a line?

### 2.2 Solution

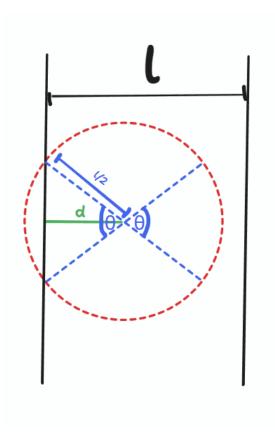

Figure 1: The black lines are the parallel lines of the paper, the red circle represents the possible area covered by the needle on a specific distance d from one of the lines.  $\theta$  is the angle in which the needle crosses one of the lines

$$\cos\left(\frac{\theta}{2}\right) = \frac{2d}{l}$$

$$\theta = 2\cos^{-1}\left(\frac{2d}{l}\right)$$

$$P(d) = 4\frac{\theta}{2\pi} = \frac{2}{\pi}\cos^{-1}\left(\frac{2d}{l}\right)$$

$$P = \int_0^{\frac{L}{2}} P(d) dd$$

$$= \frac{2}{\pi} \int_0^{\frac{L}{2}} \cos^{-1}\left(\frac{2d}{l}\right) dd$$

$$\therefore \int \cos^{-1}(x) dx = x \cos^{-1}(x) - \sqrt{1 - x^2} + c$$

$$\therefore P = \left[\frac{2d}{l}\cos^{-1}\left(\frac{2d}{l}\right) - \sqrt{1 - \left(\frac{2d}{l}\right)^2}\right]^{\frac{L}{2}} = \frac{2}{\pi}$$

#### 3.1 Problem

Find the probability distribution for the momentum of a harmonic oscillator with angular frequency  $\omega$ .

#### 3.2 Solution

$$y(t) = A\sin(\omega t)$$

$$p = my'(t) = mA\omega\cos(\omega t) = p_{max}\cos(\omega t)$$

$$t = \frac{\cos^{-1}(\frac{p}{p_{max}})}{\omega}$$

$$p' = -A\omega^2\sin(\omega t) = -A\omega^2\sin(\cos^{-1}(\frac{p}{p_{max}}))$$

$$p_f = \frac{p}{p_{max}}$$

We will absorb all constants and proportionality constants into  $\alpha$ 

$$\rho(p_f) \propto \frac{1}{p'} = \alpha \csc(\cos^{-1}(p_f))$$

$$\int_{-1}^{1} \rho(p_f) dp_f = \alpha \int_{-1}^{1} \csc(\cos^{-1}(p_f)) dp_f = \alpha \pi = 1$$

$$\alpha = \frac{1}{\pi}$$

$$\rho(p) = \frac{\csc(\cos^{-1}(\frac{p}{Am\omega}))}{\pi}$$

#### 4.1 Problem

Consider the probability density for the location of the electron inside the Hydrogen atom:

$$\rho(r) = Ae^{-2r/a_0},\tag{1}$$

where  $a_0$  is the Bohr radius.

(a) Find A which normalizes this probability distribution.

Hint:

$$\int_0^\infty e^{-x} x^n dx = n!. \tag{2}$$

(b) Calculate the probability for the electron to be found in a sphere, centered about the origin, of radius  $b_0$ , with  $b_0 \ll a_0$ .

P.S.: You can do this calculation exactly or approximately. The approximate one is much easier.

#### 4.2 Solution

(a)

$$\rho(r) = Ae^{-2r/a_0}$$

$$\rho = \int_0^\infty \rho(r) dr = 1$$

$$\rho = A \int_0^\infty e^{-\frac{2r}{a_0}} dr$$

$$\therefore \int e^{-\alpha x} dx = -\frac{e^{-\alpha x}}{\alpha} + c$$

$$\therefore 1 = -\frac{A}{\alpha} \left[ e^{-\alpha r} \right]_0^\infty = \frac{A}{\alpha}$$

$$A = \frac{2}{a_0}$$

(b) 
$$\rho(r) = \frac{2}{a_0} e^{-2r/a_0}$$

$$\frac{2}{a_0} \int_0^{b_0} e^{-\alpha x} dx = -\frac{2}{\alpha a_0} \left[ e^{-\alpha x} \right]_0^{b_0}$$

$$= 1 - e^{-2\frac{b_0}{a_0}} \approx 2\frac{b_0}{a_0}$$

#### 5.1 Problem

Consider the map

$$f: \mathbb{C} \to \mathbb{R}_{2 \times 2} \tag{3}$$

$$x + iy \mapsto \begin{pmatrix} x & -y \\ y & x \end{pmatrix}$$

from the complex numbers to the set of  $2 \times 2$  real matrices.

(a) Show that this map is an isomorphism. That is, show that it is invertible and that for  $z_1, z_2 \in \mathbb{C}$ ,

$$f(z_1 z_2) = f(z_1) f(z_2)$$
 (4)

and hence prove that, in two dimensions, rotations commute.

(b) Prove De Moivre's formula for complex numbers:

$$(r(\cos(\theta) + i\sin(\theta)))^n = r^n(\cos(n\theta) + i\sin(n\theta))$$
 (5)

and hence prove that

$$\begin{pmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{pmatrix}^n = \begin{pmatrix} \cos(n\theta) & -\sin(n\theta) \\ \sin(n\theta) & \cos(n\theta) \end{pmatrix}$$
 (6)

#### 5.2 Solution

(a)

$$f(z_1 z_2) = f((x_1 + iy_1)(x_2 + iy_2)) = f((x_1 x_2 - y_1 y_2) + i(x_1 y_2 + y_1 x_2))$$

$$= \begin{pmatrix} x_1 x_2 - y_1 y_2 & -x_1 y_2 - y_1 x_2 \\ x_1 y_2 + y_1 x_2 & x_1 x_2 - y_1 y_2 \end{pmatrix}$$

$$f(z_1) f(z_2) = \begin{pmatrix} x_1 & -y_1 \\ y_1 & x_1 \end{pmatrix} \begin{pmatrix} x_2 & -y_2 \\ y_2 & x_2 \end{pmatrix}$$

$$= \begin{pmatrix} x_1 x_2 - y_1 y_2 & -x_1 y_2 - y_1 x_2 \\ x_1 y_2 + y_1 x_2 & x_1 x_2 - y_1 y_2 \end{pmatrix}$$

We can that  $f(z_1z_2)$  is just a multiplication of two complex number and that commutes.

(b)
$$e^{i\theta} = \cos(\theta) + i\sin(\theta)$$

$$(r(\cos(\theta) + i\sin(\theta)))^{n} = r^{n}(\cos(\theta) + i\sin(\theta))^{n}$$

$$= r^{n}e^{in\theta} = r^{n}(\cos(n\theta) + i\sin(n\theta))$$
(7)

Since the rotation transformation is isomorphic.

$$\therefore \begin{pmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{pmatrix}^n \mapsto (\cos(\theta) + i\sin(\theta))^n = \cos(n\theta) + i\sin(n\theta)$$

$$\mapsto \begin{pmatrix} \cos(n\theta) & -\sin(n\theta) \\ \sin(n\theta) & \cos(n\theta) \end{pmatrix}$$
